Biological Water Treatment

NOVEMBER 2020

Three Pillars of MUTAG Engineering

Plant and Process Design

You have a problem, we have the solution! Application-specific, holistic treatment concepts based on the best available techniques, specifically tailored to the problem at hand.

We can help you by designing and constructing important parts of your treatment plant, such as tanks and basins, piping systems, steel structures and pump stations. We can also provide advice, design reviews and procurement assistance.

Technical Consulting

What works and what does not work is often not obvious at first glance. We take a closer look and identify both potential and pitfalls.

Benefit from our support, which starts from your first enquiry and includes many activities, such as the evaluation of process data, the preparation of theoretical and laboratory studies, support during pilot tests, the execution of feasibility studies and much more!

For example, do you have the impression that other plants are more energy efficient? Talk to us and find out how your plant compares to others! Let us show you the hidden optimisation potential of your plant.

Service

We are there for you from the first draft to the commissioning of the plant. It makes no difference whether it is a matter of MBBR installations for your newly designed project or the support of one of our competent engineers as supervisor during the commissioning of your plant.

Even if your plant has already been in operation for several years, we can offer you our assistance by carrying out on-site inspections. Would you like us to take a look at some wastewater samples? You can contact us and send them to our lab or, if needed, we can even take the samples by ourselves!
